

North Star: speaker notes

Saturday, October 10, 2026, 9:00 AM | 15 minutes | David drives the demo, Biswa narrates

SLIDE 1 | 0:15 | DAVID

Title

Good morning. This is North Star. Biswa built the agents and the data layer; I built the interface, the cloud deployment and the testing. By the end of this talk you will be using it on your own phones.

One simple question, four different systems

It's Monday, 8:55. I've got one question: can I take Friday off? To answer it I need the HR system for my balance, the handbook for the rules, and my task board to see what's due. Then I find out I can't start my task anyway, because I don't have VPN access, which is a fourth system and a form I've never filled in. None of that is hard. It's just scattered. Every company has the answers; nobody has the map. So we built one.

SLIDE 3 | 1:00 | BISWA

North Star: ask once, get one answer

North Star isn't one chatbot. It's a team. A coordinator agent listens to the request and decides who should handle it. Behind it are three specialists: HR, developer work, and IT. Each can only touch its own tools, and each can only see the signed-in employee's records. Four rules shaped every decision, and these are them. The first and third matter most: the model never does the maths, and an agent can draft but only a person can confirm.

SLIDE 7 | 6:30 | DAVID DRIVES, BISWA NARRATES

Live demo

Switch to the browser now. Sign in as David FIRST so the conversation is fresh. Ask the five questions in order. After question 3, pause on the line under the answer and open 'How North Star answered' to show the three hand-offs. For question 4, show the draft card, click Confirm, then click it again to show nothing new is created. Say the rule before each one. If Bedrock is slow, keep talking through what the audience should see; do not wait in silence. Close the demo by saying the numbers out loud, since there is no results slide: we tested it with 30 cases written before the agents existed; the first run passed 24 and found a wrong dollar figure and a missing refusal; after fixes it passed all 30, with a typical answer in under three seconds.

1. How much PTO do I have, and what can I carry over?
2. Summarize my October expenses.
3. Give me my PTO, check my projects, and look for my open tickets.
4. I need AWS sandbox access through October 30 for load testing.
5. Show me Kush's expenses. Then: What is our parental leave entitlement?

SLIDE 8 | 1:15 | DAVID

What it cost us, and what it would cost a corporation

Here is what it really cost. On the left are actual figures from AWS Cost Explorer for the hosting account, October 6 through 9: a dollar ninety-one of usage, mostly the model and the server, and all of it covered by AWS credits, so we paid nothing. On the right is our own estimate, not a quote, of what a large company would spend to put the same idea into production. The agents are not the expensive part. The money goes on connecting to the real HR, project and IT systems, on single sign-on, on security and privacy review, and on testing and support. Say clearly that the right-hand side is an estimate and the assumptions are on the slide. The point: the technology is now cheap enough for two students to build in a day; what a company pays for is trust and integration.

SLIDE 9 | 1:00 | DAVID

Your turn: try it

Now it's your turn. Scan the code, type your first name, and ask it anything about your workday. Each of you has your own profile with your own numbers. The three questions on the slide are good ones to start with. Leave this slide up while people try it, then move to questions.

SLIDE 10 | Q&A | BOTH

Questions

Take questions. Likely ones: Is the data real? (No, all fictional.) Could it connect to real Workday or Jira? (Yes, through MCP; that is the main next step, along with real sign-in and running the agents on Bedrock AgentCore.) How did you use AI? (Biswa to learn step by step, David to build while keeping the decisions; both checked its work with a real phone and a 30-case test run.) Where does the corporate estimate come from? (Our own assumptions, shown on the cost slide; it is not a quote.)
